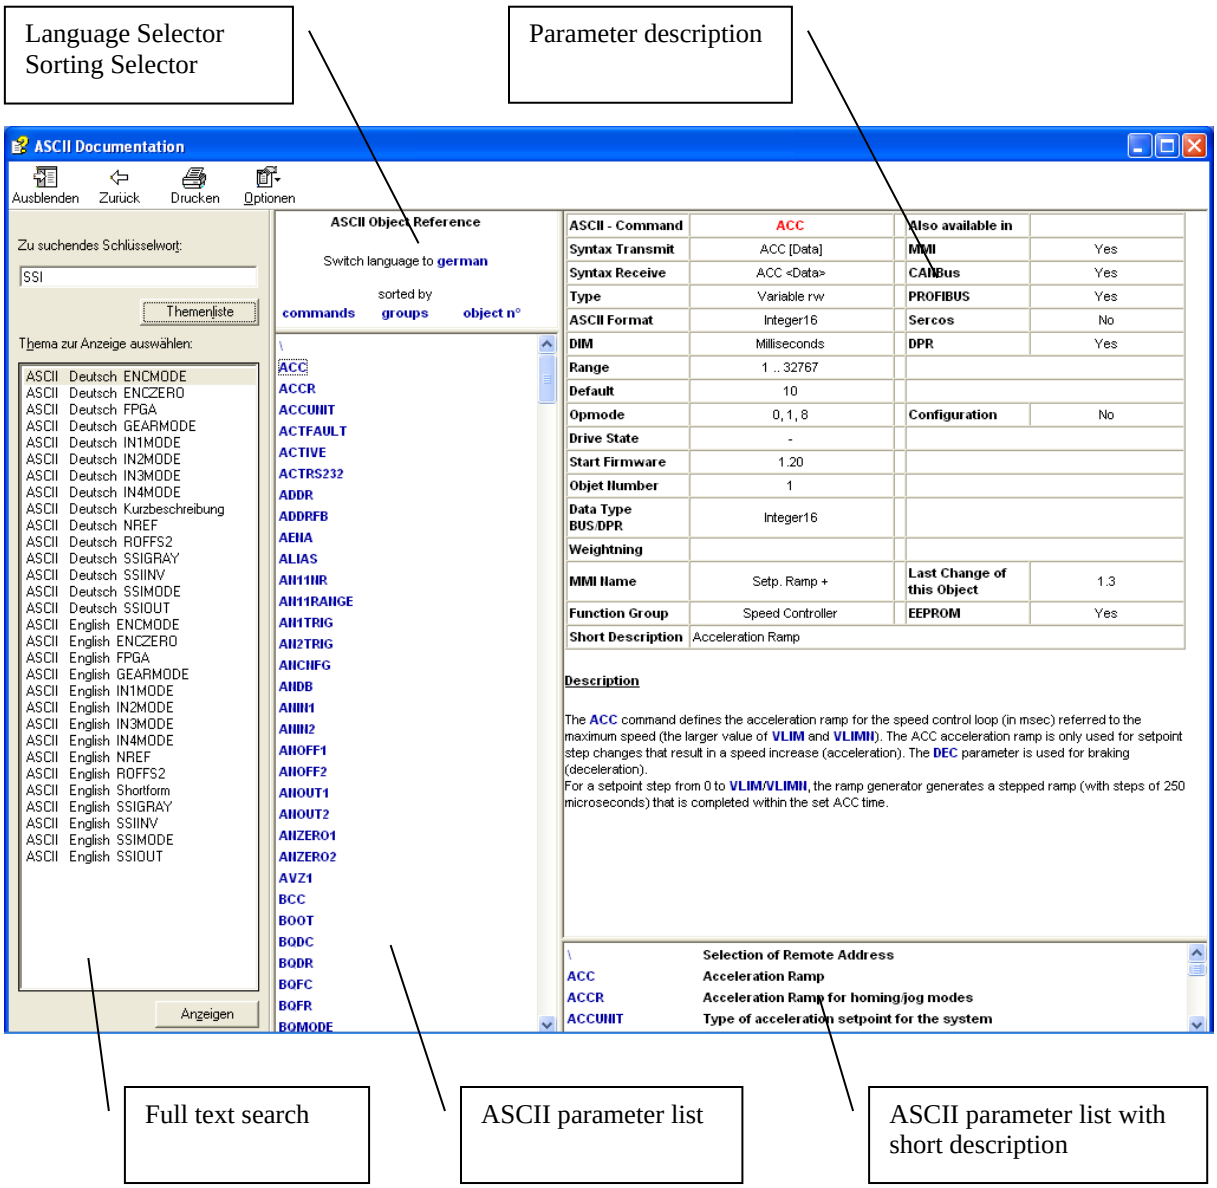
ASCII Object Reference

The ASCII Object Reference (ascii_ _ _ _ _ _.chm / pdf) describes all parameters (ASCII format) which can be transmitted with a terminal program or with the setup software to command the servo amplifier.
There are different ASCII files for different servo amplifier series. Users who have a problem with reading the Windows HTML-help file (CHM) can use the PDF files, which deliver the same information.
The online help of the setup software of S300/S700 (drivegui.chm) includes the ASCII Object Reference.
The online help of SERVOSTAR 400/600 (drive.chm) does **not** include the ASCII Object descriptions.

The CHM format file offers

- simple navigation
- variable sorting
- quick full text search in the document
- English and German language versions in one file


The Windows HTML-help file (CHM) requires Windows 98 as a minimum and also works with NT, 2000, XP, Vista, 7, 8, 10. Copy the file to a folder on your harddisk and start the file as usual with Windows.
